~~Now~~
~~from table~~

$P = 200\,w = \frac{1}{4}\,hp$

$\tau = 1.5\ Nm$

$rpm = 3000$

Now we need 700 rpm ($\approx$ 50 km/h)

$V.R = \frac{3000}{700} = 4.16$

Say $V.R = 4$ then $n_{out} = (750\ rpm)$

from table $pd = 32$

$F = \frac{12}{pd} = \frac{12}{36} = 0.3$ inch

Now

$32 = \frac{N}{D}$ ← Say $N_p = 18$ — $\phi = 20°$

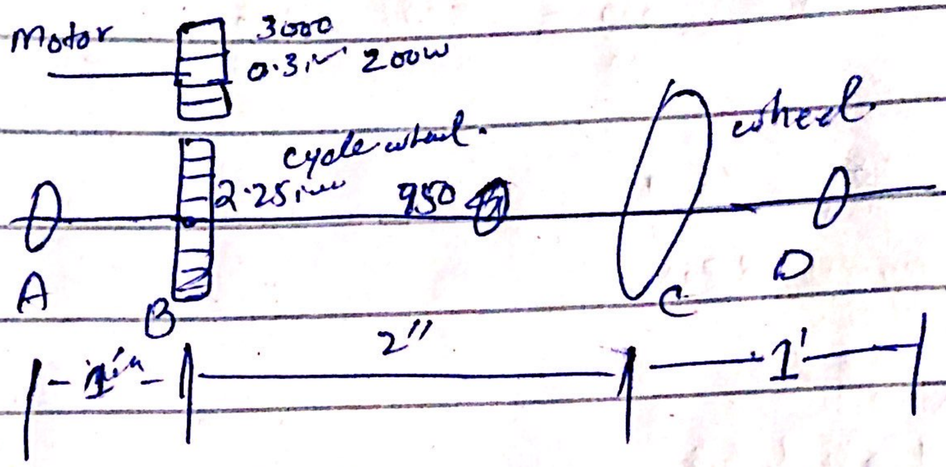
$D = \frac{18}{32} = 0.5$ $\quad N_g = (4)(18)$

$\boxed{N_g = 72}$

$\boxed{D_p = 0.5\ \text{inch}}$ $\quad \boxed{N_p = 18}$

$$P_g = \frac{N_G}{P_d} = \frac{72}{32} = 2.25 \text{ inches}$$

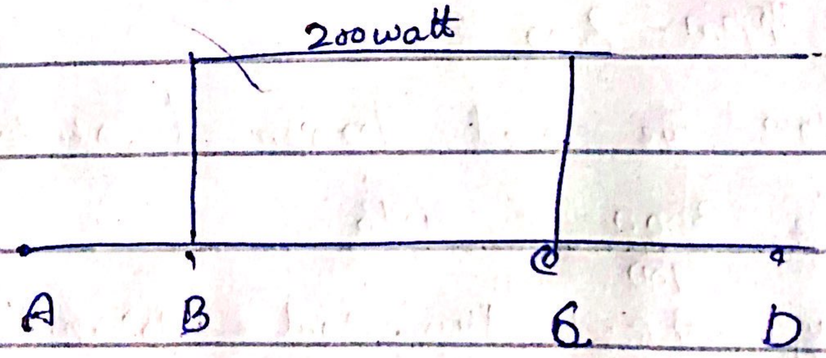
Now Shaft Design



$$P = \tau \omega$$

$$\tau = \frac{P}{\omega} = \cancel{200\,watt}\ \frac{0.25hp \times 63057}{750} = 21.09 N$$

power profile



Now $T = rf$

$$W_t = \frac{\tau}{r} = \frac{21.09}{\left(\frac{2.25}{2}\right)} = 18.74 N$$

$$W_r = 18.74 \times \tan(20°) = 6.82 N$$

$n_p = \cancel{4000}$ rpm

$n_g = 700$ rpm (~ 80 km/h)

$$V.R = \frac{\cancel{4000}\,3}{700} = \cancel{5.71}\ 4.16$$

Say 16

$\boxed{n_g = 687.5}$

Now

from table

$P = 200W = \frac{1}{4}hp$

$\tau = 1.5$ Nm

rpm = 3000

Now we need 700 rpm (~ 50 km/h)

$$V.R = \frac{3000}{700} = 4.16$$

Say $V.R = 4$ then $n_{out} = (750 \text{ rpm})$ $r = 0.2m$ (56.54 km/h)

from table $pd = 32$

$$F = \frac{12}{pd} = \frac{12}{36} = 0.3 \text{ inch}$$

Now $\phi = 20°$

$$32 = \frac{N}{D} \quad \text{Say } N_p = 18$$

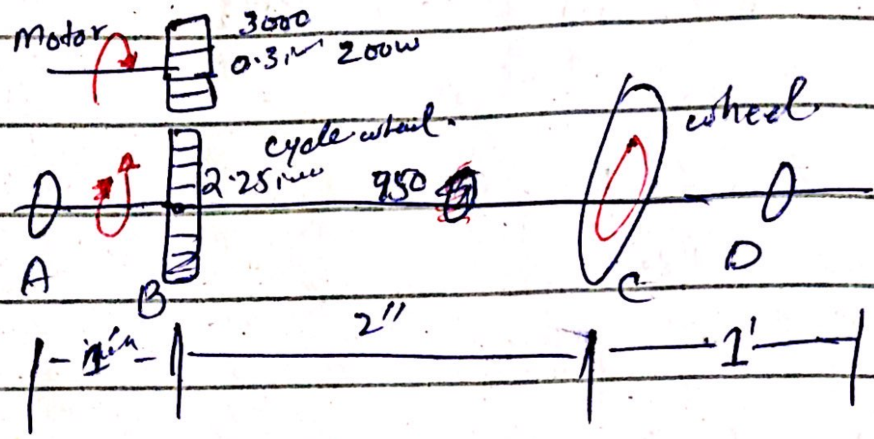
$$\cancel{32}D = \frac{18}{32} = 0.8 \qquad N_g = (4)(18)$$

$\boxed{N_g = 72}$

$\boxed{D_p = 0.5 \text{ inch}}$ $\boxed{N_p = 18}$

$$P_g = \frac{N_G}{P_d} = \frac{72}{32} = 2.25 \text{ inches}$$

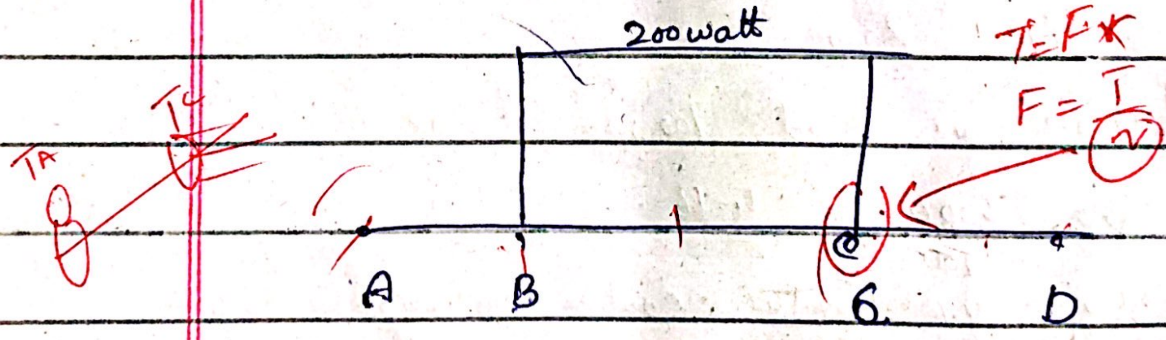
Now Shaft Design



$$P = \tau\,\omega$$

$$\tau = \frac{P}{\omega} = \frac{\cancel{200\,watt}\; 0.25\,hp \times 63057}{750} = 21.09\,Nm$$

Power profile



Now $T = rf$

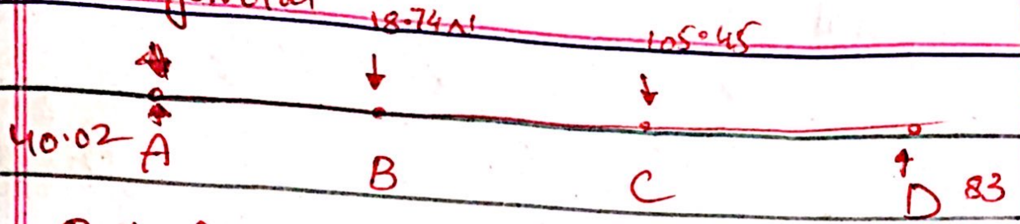
$$W_{t_B} = \frac{\tau}{r} = \frac{21.09}{\left(\frac{2.25}{2}\right)} = 18.74\,N$$

$$W_{r_B} = 18.74 \times \tan(20^\circ) = 6.82\,N$$

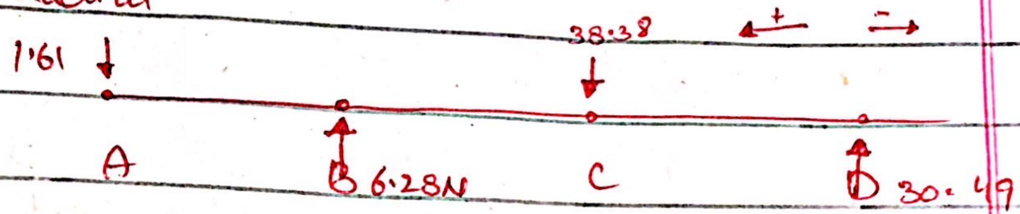
$$P_c = \tau_c\,\omega_c$$

$$\tau_c = \frac{\cancel{21.09}\; 0.25 \times 63057}{750} = 177$$

Tangential



Radial



$T = 21.09$

$T = rf$

$\frac{T}{r} = F$

$\frac{21.09}{0.2} = \boxed{W_{t_c} = 105.45\,N}$

$W_{rc} = 105.45 \times \tan(20^\circ) = 38.38\,N$

Now $\Sigma F = 0$

$\Sigma M = 0$

ΣM_{A_t} Moment at A.

$0 = 1 \times 18.74 + 3(105.45) - 4(W_{td})$

$\frac{335}{4} = \boxed{W_{tD} = 83.7725\,N}$

$\boxed{W_{rD} = 83.7725\,N \tan 20^\circ = 30.49\,N}$

$\Sigma F_t = 0$

$-A + 18.74 + 105.45 - \cancel{30}\ 83.7225$

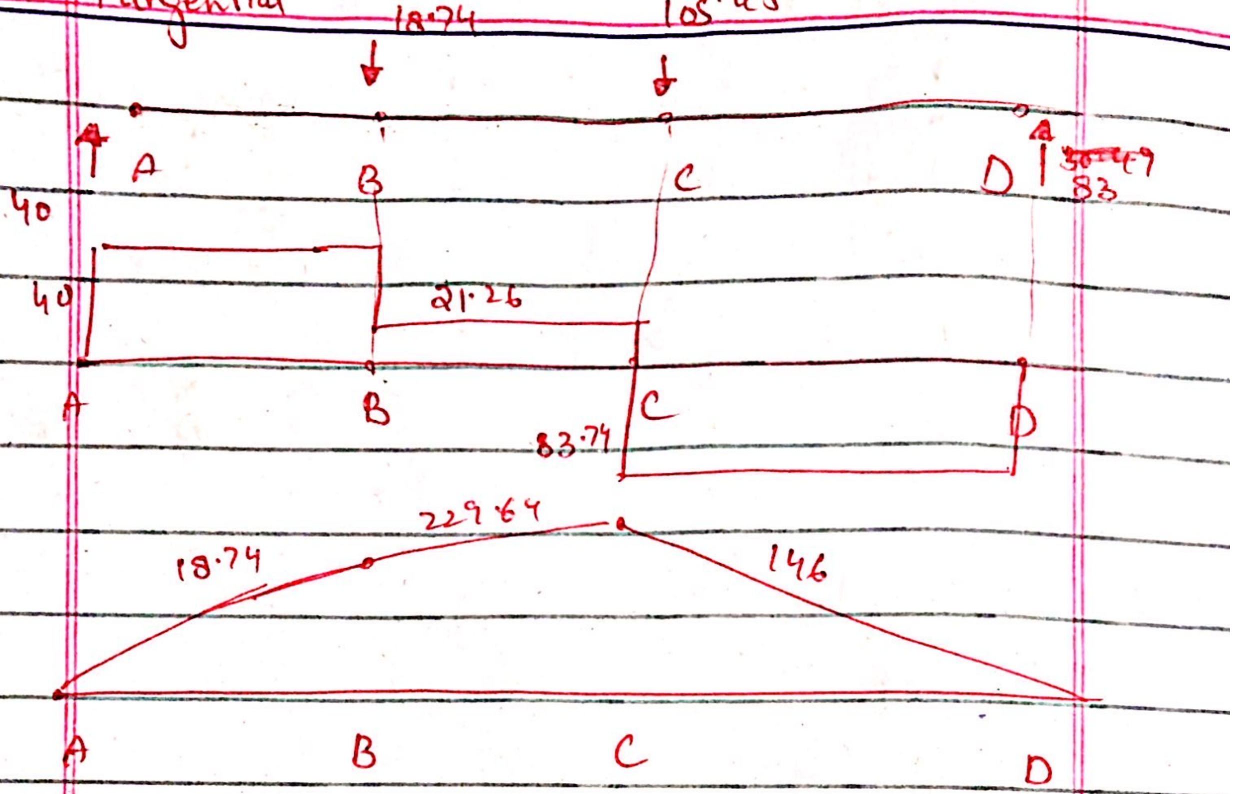
$\boxed{W_{tA} = 40.02}$

$\Sigma F_r = 0$

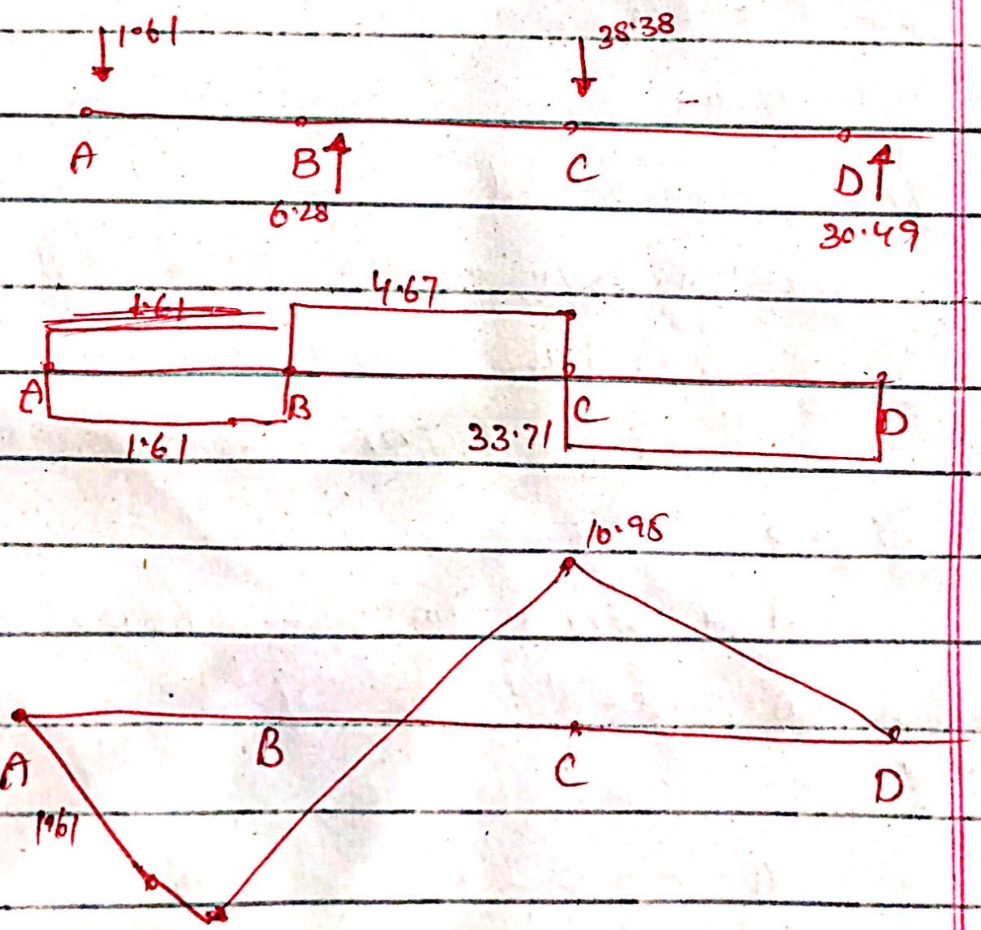
$A - 6.28 + 38.38 - 30.49$

$\boxed{W_{rA} = 1.61\,N}$

Tangential



Radial



Now stress Analysis of Gear

$P = 0.25\ hp$

$n_p = 3000$

$n_g = 750$

$N_p = 18$

$N_g = 72$

$\phi = 20°$

$V.R = 4$

Say $A_v = 6$

$k_v =$

$\boxed{J_p = 0.43}$

$\boxed{J_g = 0.334}$

$\boxed{k_v = 1.19}$

$\boxed{k_o = 1}$ $\boxed{k_s = 1}$ $\boxed{k_b = 1}$

$P_{des} = k_o \times P = 0.25\ hp$

$\boxed{C_{pf} = 0.9}$ open gearing

$\boxed{C_{ma} = 0.26}$

$\boxed{K_m = 2.16}$

$$S_t = \frac{W_t\ P_d}{F\ J}\ k_o\ k_s\ k_m\ k_b\ k_v$$

J ↳ if $k_b = 1.2$

$\boxed{\sigma_t = 16.8\ MPa}$

$$S_{tg} = \frac{(18.74)(32)}{(0.33)(0.334)}(1)(1)(2.16)(1)(1.19)$$

$S_{tg} = 13984.91\ Pa = 14\ MPa$

$$S_{tp} = \frac{(18.74)(32)}{(0.33)(0.334)}(1)(1)(2.16)(1)(1.19) = 10861.70\ Pa$$

$10.8\ MPa$

For load cycle :

Now SAE 1018 have max

MPa = 441 can be used.

$$\sigma_t\ \frac{W_t\ P_d}{F J} = \frac{(18.74)(32)}{(0.33)(0.3)}$$
