

$$Rpm = 480 \text{ rpm} = 50.256 \text{ rad/s}$$

Now

$$\frac{15 \times 10^3}{50.256} = T_A = 298.471 \text{ Nm}$$

At \textcircled{C}

$$\frac{22.5 \times 10^3}{50.256} = 447.07 \text{ Nm}$$

At \textcircled{E}

$$\frac{7.5 \times 10^3}{50.256} = 149.23$$

Now at \textcircled{A}

$$T = r f, \quad W_t = \frac{T}{r} = \frac{298.471}{100} = 2.98471 \text{ N} \quad \text{at } 0^\circ 05$$

$$W_r = 2.98471 \tan(20^\circ) \quad \text{assume min no. of teeth 18} \quad \text{at } 0^\circ 03$$

$$= 2169 \text{ N}$$

at \textcircled{C}

$$W_{tc} = \frac{T_c}{r} = \frac{447.07}{100} = 4.4707 \text{ N} = 2984.66 \text{ N}$$

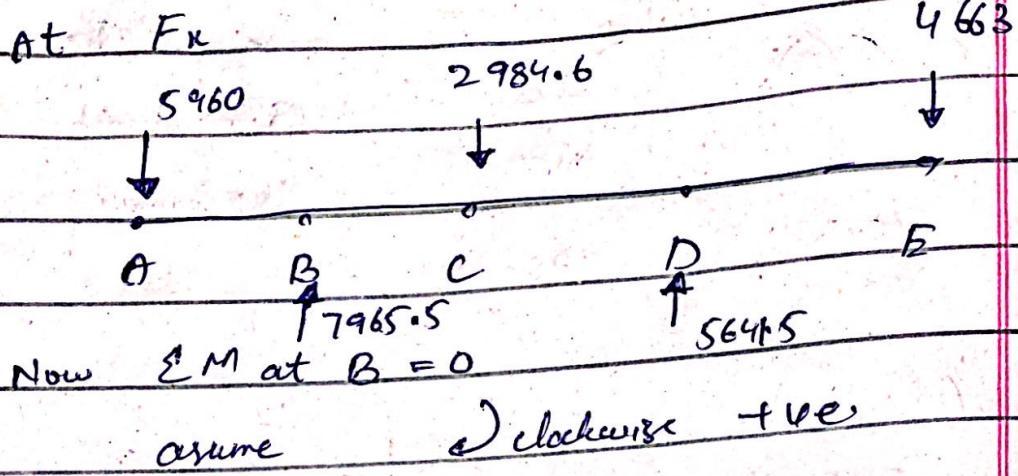

$$W_{rc} = 2984.6 \tan(0^\circ 150) = 1086.32 \text{ N}$$

at \textcircled{B}

$$W_{tb} = \frac{T_B}{r} = \frac{149.23}{100} = 1.4923 \text{ N} = 466.3 \text{ N}$$

$$W_{rb} = \frac{T_B}{r} = \frac{149.23}{100} \tan(0^\circ 032) \rightarrow 1697.35 \text{ N}$$

Taking downward forces positive

$$0 = -(5960 \times 0.1) + (2984.6 \times 0.1) - (0.2 \times D) + (4663 \times 0.3)$$

$$= -569 + 298.46 - 0.2D + 1398.9$$

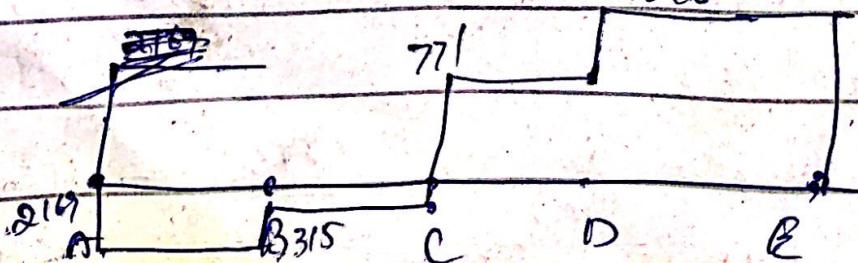

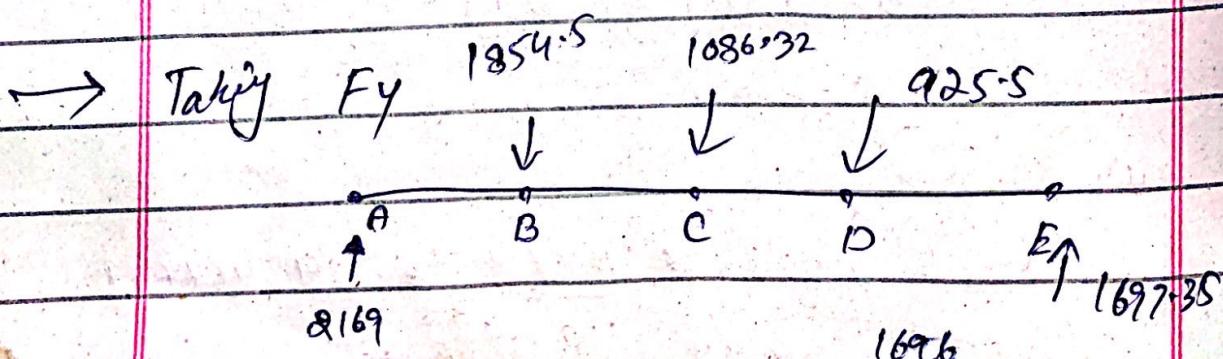

~~$22663 = D = \frac{1128.3}{0.2} = 5641.5 N$~~

~~for~~

$$\Sigma F = 0 \rightarrow$$

$$5960 + 2984.6 + 4663 - B - 5641.5 = 0$$

$$B = 7965.5$$

against $\Sigma M_B = 0$

$$0 = (2169 \times 0.1) + (0.1 \times 1086.32) + (0.2 \times D) - (0.7 \times 1697.35)$$
$$= 216.9 + 108.6 + 0.2D - 1187.85 \quad \boxed{509}$$

$$1.0 = 575.778 N$$

$$\boxed{D = 925.5}$$

$\Sigma F = 0$

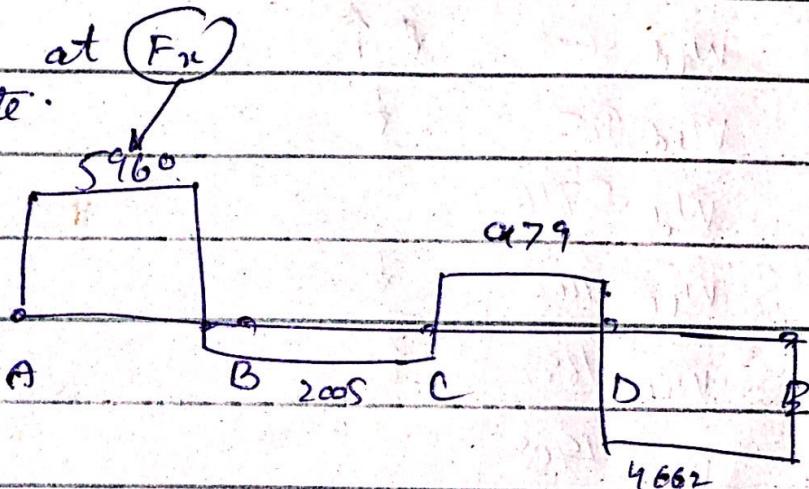

$$925.5 + 1086.32 - 1697.35 \rightarrow 169 + B$$

$$\boxed{B = 1854.5 N}$$

Now,

Steel?

$$\left[k = 0.5 \right]$$

Now choosing Rock crusher and driver
as motor K_o values as 1.75

Now

$$P_{des} = 1.75 \times 22.5 = 39.0375 \text{ kw}$$

→ get

$$\left[P_D = 4 \right]$$

$$P_{des} = 1.5 \times 1.75 = 2.625 \text{ kw}$$

$$P_{des} = 7.5 \times 1.75 = 13.125 \text{ kw}$$

Now lets get Diameters of shafts.

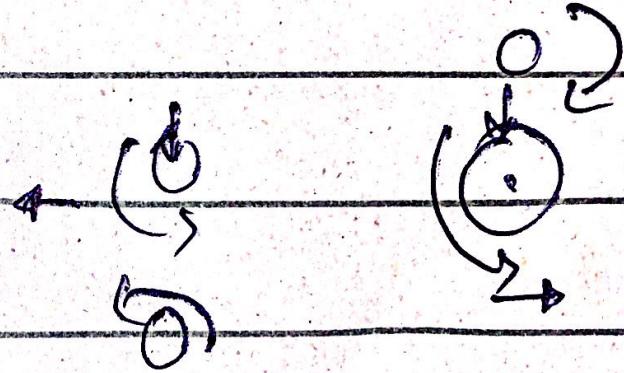

$$D = \left[\frac{32N}{\pi} \sqrt{\left(\frac{K_t M}{S_n} \right)^2 + \frac{3}{4} \left(\frac{T}{S_y} \right)^2} \right]^{1/3}$$

using $N = 3$

Design factor.

considering Steel:

$$K_t = 2.5$$

Now choosing Rock Crusher and drive

as motor R_o evolves as 1.75

Now

$$P_{des} = 1.75 \times 22.5 = 39.375 \text{ kw}$$

get

$$\text{Poles} = 15 \times 1.75 = 26.25 \text{ kw}$$

$$1 P_D =$$

$$P_{des2} = 7.5 \times 1.75 = 13.125 \text{ kw}$$

R

$P_d l = 4$, $m = 6$ from table.

$$V.R = \frac{P_{out}}{2m} = 1$$

$$V.R = \frac{15}{22.5} = 1.5$$

$$VR = 2/3$$

Say $N_g = 3/18$

then

$$N_p = 84$$

$$\boxed{N_g = 18}$$

$$N_p = 27$$

assume

Say material 4140 QT 1000

$$S_u = 1160 \text{ MPa}, S_y = 1050 \text{ MPa}$$

Now

$$S_n = (0.80)(0.81)(400 \text{ MPa}) = 259 \text{ MPa} = 259 \text{ N/mm}^2$$

$$R_s = 0.80$$

$$R_r = 0.81$$

$k_r = \text{Reliability}$

$$\gamma = 0.31$$

$$\text{Now } P_d = 400 \text{ mm}$$

$$\boxed{N_g = 120}$$

$$T = \frac{P_d}{\rho d} = 3$$

Say motor rotates at 3000 rpm off

$$\frac{3000}{60} = 50$$

$$1/0.65$$

$$22$$

$$6/6$$

$$0/45$$
